ABSTRACT

A host device (e.g., mobile device) and a wearable device can cooperate to provide location-specific information to a user. For example, a host device can maintain a store of location-specific information records. When the host device detects that its current location corresponds to a relevant location for one of the records, the host device can send the record (or a portion thereof) to a paired wearable device. The wearable device can present information content from the record to a human user and/or to a machine such as a scanner or wireless communication terminal.
